

MIRAVIS® , a new canola blackleg foliar fungicide, is registered in time for application this season.

Broadacre
30.05.2018

Dr Steve Marcroft, principal of Marcroft Grains Pathology and blackleg expert, talks about his experience with MIRAVIS at an event in Lake Bolac, Victoria.

The Australian Pesticides and Veterinary Medicines Authority (APVMA) has approved the registration of MIRAVIS® in time for foliar application in canola.

It is now available for purchase from select retailers – enquire with your local store or advisor.

MIRAVIS is Syngenta’s new foliar fungicide for the control of blackleg and white leaf spot in canola and will be a step change for the control of blackleg.

MIRAVIS has a SDHI Mode of Action - ADEPIDYN™ - which is the first SDHI belonging to a new chemical group within FRAC group 7 fungicides.

Syngenta Product Lead, Angus Rutherford said the new fungicide is expected to significantly benefit Australian canola growers.

“MIRAVIS offers a step change in control versus current industry standards for blackleg,” Angus said.

“Local trials have shown consistent yield improvements over Prosaro* and Aviator Xpro*.

“These are impressive results that will convert to a strong return on investment for growers in commercial crops.”

The high field potency and intrinsic activity of MIRAVIS delivers powerful and consistent performance.

It has excellent surface tenacity, fast uptake and optimal distribution within the plant to deliver effective and long-lasting control in variable conditions.

MIRAVIS is also registered in potatoes and grapes.
